

ME228 Final Project Stage 1

(23B2228 vanshika bansal)

Heart Disease Risk Prediction based on various health factors.

Objective:

1. Develop a regression model to estimate the probability of heart disease based on medical and lifestyle data.
2. Identify key risk factors contributing to heart disease.
3. Evaluate the model's accuracy and performance using appropriate metrics.

Deliverables:

1. Data Processing & Analysis Report
2. Machine Learning Model
3. Prediction & Insights

Source of data :

1. UCI Heart Disease Dataset (Available on Kaggle & UCI ML Repository)
2. Framingham Heart Study Dataset (Kaggle)
